

SQL Tutorial: Database Queries

Page 1: SQL SELECT Statement

The SELECT statement retrieves data from one or more database tables.

Syntax: SELECT column1, column2 FROM table_name WHERE condition;

Page 1: WHERE Clause

A WHERE clause filters rows according to a specified condition.

Only records that meet the condition are included in the result.

Page 2: JOIN Operations

An INNER JOIN returns rows when matching values exist in both tables.

Syntax: `SELECT * FROM table1 INNER JOIN table2 ON table1.id = table2.id;`

A LEFT JOIN returns all rows from the left table and matching rows from right table.
